

DryMAX

The world's first mini-split dehumidifier.

Controls Humidity
Maintains Comfort

DryMAX

Does:

- Dehumidify in all weather conditions
- Produce cool dry air, warm dry air or temperature-neutral dry air

Doesn't:

- Require high installation costs
- Take up valuable floor space
- Need to be emptied by hand
- Make excessive noise

DryMAX makes No Compromises

DryMAX

It has never been so easy
to control challenging
humid environments

In the past you were limited to...

1. Air Conditioners:

- Operate on a call for cooling, NOT dehumidification
- Don't work well when the weather is cool and rainy
- Produce cold, clammy spaces

2. Stand-alone Dehumidifiers:

- Need emptying daily
- Take up valuable floor space
- Are objectionably noisy
- Produce hot dry air in summer when the last thing you need is more heat

3. Central Installed Dehumidifiers:

- Involve high installation costs
- Need mechanical room
- Can be cost-prohibitive for many custom applications

Unique features and benefits of this new technology include:

- Uses a conventional line set for ease of installation
- Prioritizes both humidity and temperature control for maximum comfort
- Combines the performance of central dehumidifiers with the convenience of mini-splits
- Easily retrofit in an existing application with ducted and non-ducted models

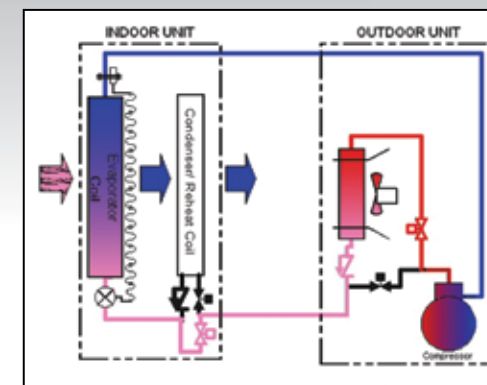

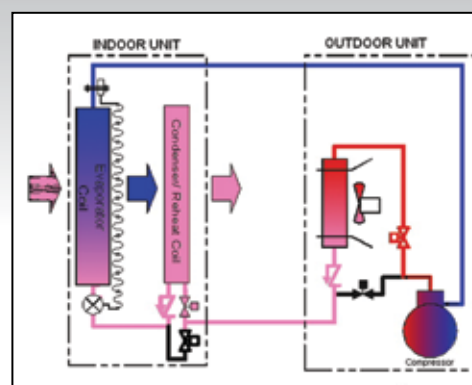

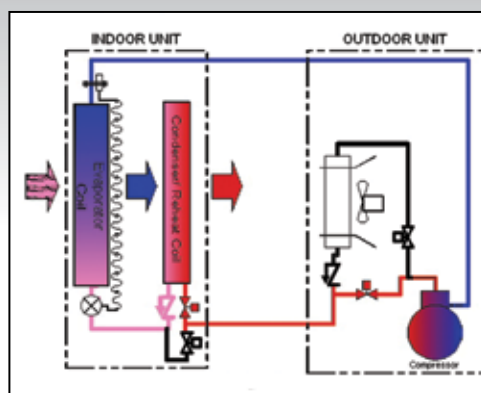

The ideal real-world solution for:

- Residential & hotel pools
- Wet and humid basements
- Libraries
- Storage
- Institutional & commercial kitchens
- Locker rooms
- Health clubs
- Wherever simultaneous / independent control of humidity and temperature is required
